(54) LIQUID CRYSTAL DISPLAY DEVICE

(57)Abstract:

PROBLEM TO BE SOLVED: To provide a liquid crystal display device which has a high anti-static effect in a liquid crystal display device of horizontal electric field mode by forming an anti-static circuit which absorbs static electricity promptly.

SOLUTION: This device changes the optical transmittance of a liquid crystal layer by an electric field component generated roughly parallelly to an active matrix substrate between a pixel electrode PX formed for each pixel PE and the counter electrode CT on the active matrix substrate. In this case, a common connecting line CLC which is placed outside the display region and electrically connects each counter electrode connecting line CL connecting counter electrodes CT and a frame-shaped shortcircuit line SB which connects each scan signal line GL and each video signal line DL respectively through non-linear resistance element NR are formed on the above surface and the shortcircuit line SB is electrically connected to the common connecting line CLC.
